---

Okay I think I understand what is going on now. The latest file I

sent has the pleural cases broken out as either discrete or diffuse.

The earlier file is probably labeled just "Pleural". Unless the diffuse

column is flagged then it is considered discrete. As far as I know, I

don't think someone can be both discrete and diffuse. Adding up the

discrete and diffuse cases in the latest file should add up to 80. This

is probably the same number you get under the column "Pleural" in the

older data file.
